

HIBINO et al. SUPPLEMENTARY MATERIALS

1. Table S1. Immune related gene models of the *S. purpuratus* genome.
2. Table S2. Toll-like receptor (TLR) gene models of the *S. purpuratus* genome.
3. Table S3. NACHT-LRR (NLR) gene models of the *S. purpuratus* genome.
4. Table S4. SRCR gene models of the *S. purpuratus* genome.
5. Table S5. Immune related transcription factor gene models of the *S. purpuratus* genome.
6. Figure legends for Supplementary Figures S1-S7.
7. Figure S1
8. Figure S2
9. Figure S3
10. Figure S4
11. Figure S5
12. Figure S6
13. Figure S7

Supplementary Table S1. Complete categorized list of immunity-related genes found in *Strongylocentrotus purpuratus* genome sequence.

I. IMMUNITY		
Gene Category	Gene model ID	Assigned name
I.A1 Immune receptors - Pattern Recognition Receptors (PRRs)		
Toll-Like Receptors (TLRs)	222 models	Please refer to Supplementary Table S2
NACTH and Leucine-rich Repeat receptors (NLRs)	203 models	Please refer to Supplementary Table S3
Scavenger Receptor Cysteine-Rich (SRCR) repeat proteins	218 models	Please refer to Supplementary Table S4
CD36-like	SPU_007495	<i>Sp-CD36 antigen-like</i>
	SPU_018904 (E)	<i>Sp-scavenger receptor B1-like</i>
	SPU_020799	<i>Sp-scavenger receptor B2-like1</i>
	SPU_025565	<i>Sp-scavenger receptor B2-like2</i>
	SPU_003486/26720 ⁽¹⁾	<i>Sp-scavenger receptor BIII-like</i>
PG-Recognition Proteins (PGRPs)	SPU_023247	<i>Sp-PGRP1</i>
	SPU_007946	<i>Sp-PGRP2</i>
	SPU_000222	<i>Sp-PGRP3</i>
	SPU_003882	<i>Sp-PGRP4</i>
	SPU_030064	<i>Sp-PGRP5</i>
Gram-Negative Binding Protein (GNBP)1/2/3	SPU_016163	<i>Sp-GNBPI/2/3A</i>
	SPU_006529/006530 ⁽¹⁾	<i>Sp-GNBPI/2/3B</i>
	SPU_024075	<i>Sp-GNBPI/2/3C</i>
RIG-I/LGP2/MDA-5	SPU_014310	<i>Sp-RIG-I like 1</i>
	SPU_025885	<i>Sp-RIG-I like 2</i>
	SPU_011866	<i>Sp-RIG-I like 3</i>
	SPU_014311	<i>Sp-RIG-I like 4</i>
	SPU_007126	<i>Sp-RIG-I like 5</i>
	SPU_014119	<i>Sp-RIG-I like 6</i>
	SPU_010536	<i>Sp-RIG-I like 7</i>
	SPU_005476	<i>Sp-RIG-I like 8</i>
	SPU_019617	<i>Sp-RIG-I like 9</i>
	SPU_016718 (E)	<i>Sp-RIG-I like 10</i>
	SPU_020020 (E)	<i>Sp-RIG-I like 11</i>
	SPU_000006 (E)	<i>Sp-RIG-I like 12</i>

(1) Two or more model IDs have been assigned to the same gene due to any of the following reasons: a) They represent duplicated models of the same gene; b) They correspond to both alleles of the same locus; c) They contain partial fragments of a gene broken up into more than one model.

(E) indicates embryonic expression of the gene model as indicated by hybridization of pooled RNA samples from egg, early blastula, gastrula and prism stage embryos to a high-density tiling array of the *S. purpuratus* genome (Samanta *et al.*, 2006)

Table S1 (cont.) - Complete list of immunity-related genes

Gene Category	Gene model ID	Assigned name
IMCV (Ips-1/MAVS/Cardif/VISA)	SPU_017445	<i>Sp-IMCV-like</i>
I.A2 Immune receptors - C-type lectin domain proteins		
Echinoidin-like	SPU_000839	<i>Sp-echinoidin-like1</i>
	SPU_000906	<i>Sp-Echinoidin / Sp-echinoidin-like2</i>
	SPU_001821	<i>Sp-echinoidin-like3</i>
	SPU_005127	<i>Sp-echinoidin-like4</i>
	SPU_015211	<i>Sp-CLECT</i>
	SPU_022861	<i>Sp-CLECT</i>
	SPU_025892	<i>Sp-CLECT</i>
	SPU_008393	<i>Sp-CLECT</i>
	SPU_022396	<i>Sp-CLECT</i>
	SPU_007040	<i>Sp-CLECT</i>
		SPU_007882 (E)
Additional small	SPU_028432	<i>Sp-CLECT</i>
C-type lectin domain proteins	SPU_010101	<i>Sp-CLECT</i>
	SPU_003618	<i>Sp-CLECT</i>
	SPU_014221	<i>Sp-ELI-like3</i>
	SPU_003774	<i>Sp-CLECT</i>
I.A3 Immune receptors - Ig superfamily		
IG _v -IG _{C1/C2} IGSF genes	SPU_013709	<i>Sp-VC1_1</i>
	SPU_030071 (E)	<i>Sp-VC1_2</i>
	SPU_030081	<i>Sp-VC1_3</i>
	SPU_000577	<i>Sp-IGv fragment</i>
	SPU_011076	<i>Sp-JAM-like1</i>
	SPU_002608 (E)	<i>Sp-VC2_1</i>
	SPU_012388	<i>Sp-IGv-c1</i>
	SPU_024439 (E)	<i>Sp-SIRPB/G-like1</i>
		SPU_024787
B7-like IGSF genes	SPU_010746	<i>Sp-B7-like1</i>
	SPU_017228	<i>Sp-B7-like2</i>
	SPU_020457	<i>Sp-B7-like3</i>
	SPU_028300	<i>Sp-B7-like4</i>
	SPU_028510	<i>Sp-B7-like5</i>
ITAM-containing Ig	SPU_013624	<i>Sp-IG/ITAM-c1</i>

(1) Two or more model IDs have been assigned to the same gene due to any of the following reasons: a) They represent duplicated models of the same gene; b) They correspond to both alleles of the same locus; c) They contain partial fragments of a gene broken up into more than one model.

(E) indicates embryonic expression of the gene model as indicated by hybridization of pooled RNA samples from egg, early blastula, gastrula and prism stage embryos to a high-density tiling array of the *S. purpuratus* genome (Samanta *et al.*, 2006)

Table S1 (cont.) - Complete list of immunity-related genes

Gene Category	Gene model ID	Assigned name
I.A3 Immune receptors - Ig superfamily (cont.)		
Genes for which no models with evident homology or similar domain structure could be found using the search criteria detailed in <i>Materials and Methods</i> : CD14, CD244/NKCR2B4, KIR-like p91A, KIRs, KLRDs, LAIR, LIR, Ly49/NKR, NKp30, NKp44, NKp46, NKp80, NITR, CD66/CEACAM1, SIGLEC, Leukotriene B4 Receptor 1/2, CysteinyI-leukotriene Receptor 1		
I.A4 Genes associated with VDJ recombination		
TdT/Pol- μ	SPU_009980	<i>Sp-TdT1 / Pol-μ</i>
Rag1	SPU_027600 (E)	<i>Sp-Rag1L</i>
Rag2	SPU_030091 (E)	<i>Sp-Rag2L</i>

(1) Two or more model IDs have been assigned to the same gene due to any of the following reasons: a) They represent duplicated models of the same gene; b) They correspond to both alleles of the same locus; c) They contain partial fragments of a gene broken up into more than one model.

(E) indicates embryonic expression of the gene model as indicated by hybridization of pooled RNA samples from egg, early blastula, gastrula and prism stage embryos to a high-density tiling array of the *S. purpuratus* genome (Samanta *et al.*, 2006)

Table S1 (cont.) - Complete list of immunity-related genes

Gene Category	Gene model ID	Assigned name	
II.B1 Intercellular signaling (Cytokines and Growth Factors) - Interleukins, Cytokines and Hematopoietins (cont.)			
Genes for which no models with evident homology or similar domain structure could be found using the search criteria detailed in <i>Materials and Methods</i> : IL-1a/b, IL-1R2/CD121b, IL-1R-like1, IL-2, IL-2RA/CD25, IL-2RB/CD122, IL-2Rgamma/CD132, IL-3, IL-3RA/CD123, IL-4, IL-4R/CD124, IL-5, IL-5R/CD125, IL-6, IL-6RA/CD126, IL-6ST/CD130/gp130, IL-7, IL-7RA/CD127, IL-8/CXCL8, IL-8RA/B, IL-9, IL-9R, IL-10RA, IL-10RB, IL-11, IL-11R/CD130, IL-12a/b, IL-12Rbeta1, IL-13, IL-13RA, IL-15, IL-16, IL-18, IL-18R, IL-19, IL-20, IL-20RA, IL-21, IL-21R, IL-22, IL-22RA, IL-23, IL-23R, IL-24, IL-26, IL-27, IL-27RA/WSX-1, IL-28, IL-28RA, IL-29, OSM, LIF, OSMR/LIFR, CSF1/M-CSF, CSF2/GM-CSF, CSF3/G-CSF, CSFR, INF-alpha/beta/gamma/kappa/omega/zeta, IFNR1/2, Epo, EpoR, CXCL1(ELR+) family [CXCL1,2,3,5,6,7,8,14,15], CXCR1/IL-8RA, CXCR2/IL-8RB, CXCL(ELR-) family [CXCL4,9,10,11,12,13,16], CXCR3-6, CCL family [CCL1-28], CCR1-10, XCL1/2, XCR1, CX3CL1, CX3CR1.			
II.B2 Intercellular signaling (Cytokines and Growth Factors) - TNF pathway			
TNF Superfamily	SPU_009527	<i>Sp-Tnfsf_like2</i>

* Domain Structure: SP, signal peptide; SRCR, Scavenger Receptor Cystein-Rich repeat; TM, transmembrane domain; WSC, WSC domain [carbohydrate binding domain present in Wall integrity and Stress response Component (WSC) proteins, polycystin and fungal exoglucanase]; HYR, Hyalin Repeat domain; GPS, G-protein-coupled receptor proteolytic site domain; TIL, domain found in proteinase inhibitors and many extracellular proteins; Somat, Somatomedin B-like domains; F5_F8_type_C, Factors V and VIII/discoidin (DS) domain; RNaseH, RNase H domain; PTPc, Protein tyrosine phosphatase, catalytic domain.

‡ Status: pp, probably partial gene model.

(E) indicates embryonic expression of the gene model as indicated by hybridization of pooled RNA samples from egg, early blastula, gastrula and prism stage embryos to a high-density tiling array of the *S. purpuratus* genome (Samanta et al., 2006)

(1) Two or more model IDs have been assigned to the same gene due to any of the following reasons: a) They represent duplicated models of the same gene; b) They correspond to both alleles of the same locus; c) They contain partial fragments of a gene broken up into more than one model..

(E) indicates embryonic expression of the gene model as indicated by hybridization of pooled RNA samples from egg, early blastula, gastrula and prism stage embryos to a high-density tiling array of the *S. purpuratus* genome (Samanta et al., 2006)

LEGENDS TO SUPPLEMENTARY FIGURES

Figure S1. Structure of the sea urchin TLR types. **(A)** Representative typical sea urchin TLR of “vertebrate-type” structure (Sp-Tlr082, SPU_015303). **(B-C)** Two sea urchin TLRs with protostome-like structure: **(B)** Sp-Tlr066 (SPU_011823) and **(C)** Sp-Tlr041 (SPU_007859). **(D)** Structure of a “Short-type” TLR (Sp-Tlr159, SPU_001458). Box colors represent the following domains: Pink, signal peptide; red, LRRNT; blue, LRRCT; gray shading, transmembrane region; green, TIR domain. Amino acids highlighted in yellow denote consensus LRR hydrophobic residues. The consensus sequence is shown in (A).

Figure S2. Analysis of TIR domain sequences from sea urchin protostome-like TLR genes. **(A)** Phylogenetic tree of bilaterian Toll-like receptors. One Sp-Tlr is represented from each subgroup. Red genes denote protostome-like LRR pattern (see text), while blue genes denote vertebrate-like LRR pattern (single LRRNT and LRRCT flank all LRRs). All protostome-like TLR gene TIR sequences cluster together. This protostome TLR clade includes the TIR domains from the three sea urchin protostome-like TLR genes (shown in black ovals). *Caenorhabditis elegans* and *Nematostella vectensis* have only one TLR gene each and they are of the protostome type. A small divergent subclass of Sp-TLR genes with very short extracellular domains does not clearly cluster with either TLR class. **(B)** Alignment of C-terminal region of the TIR domain. TIR domains are composed of five β -sheets and five α -helices alternatively spaced (three of which are here denoted with green boxes). The region between the fifth β -sheet and α -helix is shorter in protostome-type Toll genes than in vertebrate genes (Rock et al, 1998). A

diagnostic gap after the fifth β -sheet is denoted by a shaded box. The three protostome-like Sp-TLR genes have shorter β -sheets than those in vertebrates and other Sp-TLR genes, and hence both the extracellular LRR motifs and cytoplasmic TIR domain structures exhibit affinities with the protostome-type TLRs.

Figure S3. Variation in LRR sequence among closely related TLR sequences. (A)

Typical single amino acid substitutions and smaller insertion/deletions. These mutations are seen within LRR motifs. **(B)** An example of larger insertions flanking LRRs. TLR subfamily Group III has the largest insertion (16 amino acids) of the Sp-Tlr genes. Some gene models have a cysteine pair within the insertion. A smaller insertion is located at the end of LRR 5. **(C)** An unusual insertion of complete LRR motifs found in one sea urchin TLR subgroup (Group IB). The number of inserted LRRs (1-3) varies in closely related genes. The amino acid sequence is highly similar among inserted LRRs. LRR number designations are taken from the related Group IA which does not exhibit this type of insertion. Shaded amino acids denote insertions. Blue boxes delineate LRR motifs. Red residues denote conserved patterns of LRR hydrophobic amino acids.

Figure S4. Domain structure of representative Sp-NLRs. Sp-NLR protein sequences

from Cluster 1 **(A)** and 2 **(B)** are shown with the different domains boxed in pink (DEATH), yellow (NACHT) and black (LRRs). The sequence in B is that of the GENSCAN prediction (Supertig112651_2: 4,654 -20,780), which has two DEATH domains; the Glean3 prediction has a single DEATH domain. LRRs that were found through a HMMER search using the Pfam LRR_1, LRR_2 and LRR_3 consensus sequences are designated. However, several other sequences related to the core LxxLxL

sequence can readily be identified. The LRRs in these genes are encoded in complex exon/intron structures that are poorly represented in the gene predictions. Nonetheless, clear evidence of their presence can be found in multiple gene models within each cluster of the phylogenetic tree (Fig. S5).

Figure S5. Neighbor joining tree of sea urchin NLR genes. This tree was constructed using 193 NLR NACHT domain amino acid sequences. Clusters referred to in the text and in Table S3 are indicated. Numbers indicate bootstrap values.

Figure S6. Expression analysis of NLRs from clusters 1 and 2. Quantitative PCR was performed as described elsewhere (Fugmann et al., 2006) on cDNA from adult tissues, including unseparated coelomocytes and coelomocyte fractions. Degenerate oligonucleotides that recognize a conserved region of the NACHT domain of gene models from clusters 1 and 2 were used as primers. TF: tube feet, OE: oesophagus, M: mesentary, GUT: gut, TE: testis, OV:ovary, C: coelomocytes, P: phagocytes, V: vibratile cells, CS: colorless spherule cells, RS: red spherule cells.

Figure S7. Phylogenetic tree of the thioester protein family. A pairwise alignment method was used to align the sequences in ClustalX (Thompson et al., 1997) and subsequent editing was done by hand using Bioedit sequence alignment editor (Hall, 1999). A consensus tree constructed in PAUP* (Swofford, 2002) using maximum parsimony method with 1000 bootstrap replicates is shown as a phylogram. The horseshoe crab α_2 macroglobulin sequence was chosen as the outgroup. Similar

cladogram results were obtained using a maximum parsimony method in MEGA3 (Kumar et al., 2004), and a Bayesian method in Mr. Bayes (Ronquist and Huelsenbeck, 2003). The Bayesian method was used with default priors and a GTR gamma-distributed rate variation across sites and with a proportion of variable sites. The cladistic grouping of the sea urchin sequences, Sp-C3, Sp-C3-2, TCP-1, TCP-2 and Sp-a2m were the same using PAUP*, Bayesian and MEGA3 methods. Although the tree shows support for a separate clade that includes all invertebrate C3-like sequences with the exception of the protochordates, it is likely that this is an artifact caused by the limited number of invertebrate thioester proteins, and that these genes are orthologous to the vertebrate C3/4/5 genes. Furthermore, the placement within the tree of α 2m from *Ciona* and sea urchin plus TCP-1 and -2 may be due to long branch attraction based on the elongated 3' end of these sequences. Whether these gene models are correct will require additional investigation. Amino acid sequences were collected from GenBank or the Sea Urchin Annotation website: C3 coral, *Swiftia exserta*, AY186744; C3 sea urchin, *Strongylocentrotus purpuratus*, AAC14396; C3-2 sea urchin, *Strongylocentrotus purpuratus*, SPU_000997; TCP-1 sea urchin, *Strongylocentrotus purpuratus*, SPU_022988; C3 amphioxus, *Brachiostoma belcheri*, AB050668; C3 halocynthia, *Halocynthia roretzi*, AB006964; C3 mouse, *Mus musculus*, P01027; C3 human, *Homo sapiens*, NM_000064; C3 hagfish, *Eptatretus burgeri*, Z11595; C3 lamprey, *Lethenteron japonica*, D10087; C3 cobra, *Naja naja*, Q01833; C3 chicken, *Gallus gallus*, I50711; C3 grass carp, *Ctenopharyngodon idella*, AAQ74974; C3-1 ciona, *Ciona intestinalis*, AJ320542; C3-2 ciona, *Ciona intestinalis*, AJ320543; C3 horseshoe crab, *Carcinoscorpius rotundicauda*, AAQ08323; C4 xenopus, *Xenopus laevis*, D78003; C4
